

Summary of risk management plan for aripiprazole

This is a summary of the risk management plan (RMP) for aripiprazole. The RMP details important risks of aripiprazole and how more information will be obtained about aripiprazole's risks and uncertainties (missing information).

Aripiprazole's summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how aripiprazole should be used.

Important new concerns or changes to the current ones will be included in updates of aripiprazole's RMP.

I. The medicine and what it is used for

Aripiprazole is authorised for treatment of schizophrenia, moderate to severe manic episodes in Bipolar I Disorder and for the prevention of a new manic episode (see SmPC for the full indication). It contains aripiprazole as the active substance and it is taken orally in form of tablets.

II. Risks associated with the medicine and activities to minimise or further characterise the risks

Important risks of aripiprazole, together with measures to minimise such risks and the proposed studies for learning more about aripiprazole's risks, are outlined below.

Measures to minimise the risks identified for medicinal products can be:

- Specific information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorised pack size — the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status — the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute *routine risk minimisation* measures.

In addition to these measures, information about adverse reactions is collected continuously and regularly analysed so that immediate action can be taken as necessary. These measures constitute *routine pharmacovigilance activities*.

If important information that may affect the safe use of <invented name> is not yet available, it is listed under 'missing information' below.

II.A List of important risks and missing information

Important risks of aripiprazole are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient

proof of a link with the use of aripiprazole. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine);

Summary of safety concerns	
Important identified risks	Extrapyramidal symptoms (EPS), including tardive dyskinesia
	Neuroleptic malignant syndrome (NMS)
Important potential risks	Seizures
	Hyperglycaemia/diabetes
	Suicide-related events
	Orthostatic hypotension
	Dyslipidemia
Missing information	Use in pregnancy and lactation
	Use in paediatric population

II.B Summary of important risks

The safety information in the proposed Product Information is aligned to the reference medicinal product.

II.C Post-authorisation development plan

II.C.1 Studies which are conditions of the marketing authorisation

There are no studies which are conditions of the marketing authorisation or specific obligation of aripiprazole by Krka.

II.C.2 Other studies in post-authorisation development plan

There are no studies required for aripiprazole by Krka.
